

Infinite Regeneration

A JavaScript and HTML example incorporating randomness, mouse events, and a form element. The title 'Infinite Regeneration' refers to the content of the example - which comprises: an image of a council estate under threat of demolition; references to sham local government consultation (data-gathering) exercises; and word cloud that points to how such exercises can break up and displace predominantly working class communities. A working example can be found at: <http://resources.theanthillsocial.co.uk/experiments/infinite-regen/index.html>

Setup

Open VS Code and create a folder for this weeks work. I've created a folder called **week5-inputs** and in that, another called **infinite-regen** which is the title I gave to the example I created.

Create the file structure

This example combines separate a CSS, JavaScript, and JPG file into an HTML file called index.html. First create empty **mystyle.css**, **index.html**, and **mycode.js** files.

Second download the image file from:

<http://resources.theanthillsocial.co.uk/experiments/infinite-regen/cress.jpg>

- ✓ week5-inputs
- ✓ infinite-reg... U, ↵
-  cress.jpg
-  index.html
- JS** mycode.js
- #** mystyle.css

Write index.html

```
<!DOCTYPE html>
<html>
<head>
  <title>Infinite Regeneration</title>
  <meta name="viewport" content="width=device-width, initial-scale=1">
  <link rel="stylesheet" href="mystyle.css">
</head>
<body onmousemove="moveMe(event);" onclick="createShamConsultation(event);">

  <input type="submit" id="tracker">
  <div id="home">    </div>

  <script src="mycode.js"></script>

</body>
</html>
```

Write mystyle.css

```
html, body {
  height: 100%;
}
body { /* This centers our drawing. */
  margin: 0;
  display: flex;
  justify-content: center;
  align-items: center;
  background: rgb(60,63,60);
}
#home{ /* The HTML id of the drawing. */
  position: relative;
  height: 450px;
  width: 800px;
  background-image: url('cress.jpg');
  background-size: 100%;
}
.word{ /* Default style of each word & allows them to be assigned x/y coords. */
  position: absolute;
  background: rgba(200, 200, 200, 0.4);
  width: 200px;
  text-align: center;
  font-family: Courier;
  height: 20px;
  font-size: 14px;
  line-height: 20px;
  z-index: 1;
  color: rgb(60,63,60);
}
input{ /* Ensures submit remains above all other tags and can move anywhere. */
  position: fixed;
  z-index: 2;
  padding: 15px;
  width: 100px;
  text-transform: uppercase;
}
```

Lets code mycode.js

Global variables

Setup global variables which are available to every function.

```
// Setup global variables
const home = document.getElementById("home");
const submit = document.getElementById("tracker");
const words = [
  "consultation",
  "financial-viability",
  "displacement",
  "killing-community",
  "social-cleansing",
  "governance",
  "demolition",
  "destroyed homes",
  "for-profit",
  "affordability",
  "party-politics"
];
let intensity = 0;
```

Create div tag

This function automatically generates an HTML tag. Can you see the intentional error? :

```
/* Function to create an HTML tag at
   x/y coordinates relative to #home */
function createTag(word, x, y, d){
  let tag = document.createElement("div");
  tag.innerHTML = word;
  tag.setAttribute("class", "word");
  tag.style.left = x+'px';
  tag.style.top = y+'px';
  tag.style.transform = "rotate("+d+"deg)";
  home.appendChild(tag);
}
```

The HTML tags it generates look like this:

```
<div class="word" style="left:16px;top:452px; transform:rotate(0deg);">consultation</div>
```

Loop through words

This function:

1. Loops through our word array.
2. Generates random x/y coordinates.
3. Generates a random rotation of the body (between -4 and 4 degrees).
4. Keeps repeating (its a recursive function) on a timer until 500 words have been generated.

```
// Loops through words array
function createShamConsultation(){
  let x, y;
  let body = document.body;
  for(word=0; word<words.length; word++){
    x = createRandom(-100,700);
    y = createRandom(-50,500);
    d = createRandom(-4,4);
    createTag(words[word], x, y, d);
    intensity++; // # Num of words
  }
  body.style.transform = "rotate("+d+"deg)";
  console.log('generated words');

  // Keep generating until 500 words
```

```

    setTimeout(function(){
        if(intensity>=500){
            home.innerHTML = "";
            intensity=0;
        }else{
            createShamConsultation();
        }
    }, 50); // Timer
}

```

Can you work out what this conditional is doing?

```

if(intensity>=500){

```

Follow mouse

The `moveMe()` function is triggered by the following attribute of the body tag in index.html:

```
onmousemove="moveMe(event)"
```

Likewise, The `createShamConsultation()` function is triggered by the following attribute of the input tag in index.html:

```

onclick="createSham
Consultation(event);"

```

```

function moveMe(event){
    submit.style.left=(event.pageX-50)+'px';
    submit.style.top=(event.pageY-30)+'px';
}

```

Generate number

This function generates a random number within a range.

```

function createRandom(from, to){
    let r1 = [0.0,1.0];
    let r2 = [from,to];
    let rand = Math.random();
    return Math.floor((rand-r1[0])*(r2[1]-r2[0]))/(r1[1]-r1[0])+r2[0];
}

```

Finally

A handy command at the end of the script - if this prints "all OK" to the console then we know there are no JavaScript errors.

```

console.log('all OK');

```

For the complete **mycode.js** script take a look at: <http://resources.theanthillsocial.co.uk/experiments/infinite-regen/mycode.js>
